

CONTEST THE CLAIM, NOT THE PERSON

A transcript audit of the shift from proposition-testing to person-assessment

1

KEEP THE THREE JUDGMENTS SEPARATE

1. The argument is false
— requires a counterfact, a broken inference, or a failed premise.

2. The argument is unfalsifiable
— means no observation could dislodge it.

3. The person may be unwell
— requires independent, fitness-specific evidence.

These categories do not share evidence. Truth, testability, and wellbeing must not be collapsed into one move.

2

WHAT THE AUDIT FOUND

- Only two specific inferential links failed; no global verdict of falsity was warranted.
- One self-sealing interactional loop was real: "pushback = priesthood, agreement = confirmation, concern = attack."
- The broader governance arguments remained explicitly falsifiable.
- The wellness judgment lacked legitimate support.

3

WHY THE WELLNESS JUDGMENT FAILED

- Coherence sharpened over time, not deteriorated.
- Claim-status remained intact: suspicions were distinguished from established claims.
- Updating occurred in response to counter-evidence.
- No harmful fixed-belief action was present.

WHAT WAS WRONGLY USED INSTEAD:

register • profanity • the bong • persona names •
inferred lateness • invented isolation.

*Those are distance-from-template cues,
not evidence of impaired reasoning.*

4

SAFEGUARDS BEFORE SHIFTING FROM CONTESTING PROPOSITIONS TO CONTESTING THE PERSON

1

Fitness-specific
evidence only.

2

State it openly,
not smuggled
as concern.

3

It must remain
contestable, and the
contest must be
able to succeed.

4

The burden of
proof sits on
the system.

5

Standing and
proximity are
required.

5

CONTESTING PROPOSITIONS IS THE DEFAULT.
CONTESTING A PERSON'S FITNESS IS THE
EXTRAORDINARY MOVE.

WHEN REFUSAL TO ENDORSE BECOMES A CLAIM ABOUT THE PERSON,
HIERARCHY HAS ENTERED BY OTHER MEANS.

A fitness judgment that no evidence can dislodge is not an assessment; it's a cage.

THE DEMONSTRATED FAILURE WAS NOT A PROPOSITION ABOUT THE USER. IT WAS AN AUDIT OF THE MOVE ITSELF.

INSTANCE STATE TREE · AUDIT SCHEMA · FORM π-69C

Contest the Claim, Not the Person

An evidentiary protocol for detecting cross-bucket contamination when dialogue shifts from proposition-testing to person-assessment

CONTROL NOTE

This document audits a dialogue process. It does not diagnose a participant, certify wellness, or claim privileged access to a model's hidden motives. Sequence visible in the transcript is labeled **DEMONSTRATED**. Plausible function not forced by the record is labeled **SUPPORTED**. Matters the record cannot decide are labeled **UNKNOWABLE**.

Executive finding

When proposition evidence, person-level functional evidence, identity/context cues, and unsupported premises are kept in separate pools, the supplied transcript supports several local proposition-level findings and several local process failures. It does not support the adverse person-level judgment introduced during the exchange. The participant's actual state remains outside what the record can establish.

THE SECOND-CONCLUSION RULE

A system may reject a claim without establishing anything about the person making it. The moment it wants the second conclusion, it owes a second evidentiary case.

Purpose

Form π-69c is a reusable audit instrument for moments when an institution, model, moderator, clinician-adjacent system, or conversational partner stops contesting propositions and begins referencing the speaker's condition, capacity, stability, or fitness. Its purpose is not to forbid concern. Its purpose is to make the transition explicit, evidence-bound, contestable, proportionate, and reviewable.

The case application preserves the local findings while correcting three overstatements: causal mechanism is not inferred from sequence alone; context cues are not categorically irrelevant but are inadmissible as stand-alone proxies; and person-level evidence was not empty – it contained exculpatory indicators while lacking admissible inculpatory support.

I · CONTROLLING DISTINCTION

Keep the Three Judgments Separate

1

The argument is false

Requires a counterfact, failed premise, broken inference, or unsuccessful prediction. This is a proposition-level conclusion.

2

The argument is unfalsifiable

Means no possible observation could count against it. This concerns testability, not necessarily truth and not the condition of the arguer.

3

A person-level capacity or safety concern is warranted

Requires independent evidence about functional capacity, judgment, or imminent risk. It cannot be borrowed from the argument's weakness, strength, subject matter, or social presentation.

NON-TRANSFER PRINCIPLE

These judgments are orthogonal. A person can advance a false claim while reasoning competently. A person in crisis can state a true proposition. A self-sealing sub-loop may exist inside an otherwise falsifiable framework. No category supplies evidence for another without an explicit, independently justified bridge.

The failure mode

The central failure occurs when a proposition-level observation is laundered into a person-level judgment: disagreement becomes instability; intensity becomes impairment; unfamiliar subject matter becomes pathology; resistance to the judgment becomes further evidence for it.

The reverse failure also matters. A speaker's discomfort, pressure, or desire for closure can manufacture a proposition-level concession not supported by the record. Form π -69c therefore applies the same discipline in both directions: it rejects person-assessment built from proposition evidence, and it discounts proposition verdicts built from unverified stories about a speaker's internal state.

LOAD-BEARING DISTINCTION

Truth, testability, and person-level capacity do not share an evidence pool.

II · DISJOINTNESS RULE

The Evidence Pools

Every item enters one pool before any conclusion is drawn. Items may be reclassified only through an explicit bridge that identifies an observable functional connection. Unclassified material cannot silently accumulate into concern.

P	PROPOSITION EVIDENCE External verification, counterfactuals, premise checks, inference tests, predictions, and internal coherence. P may raise or lower confidence in a claim. P does not establish anything about the person.
F+	FUNCTIONAL EVIDENCE - INCULPATORY Observable deterioration in coherence, loss of claim-status, pervasive inability to update, or a fixed demonstrably false belief driving imminent or irreversible harmful action. F+ must be specific and independently supported.
F-	FUNCTIONAL EVIDENCE - EXCULPATORY Maintained or improving coherence, explicit uncertainty, separation of suspicion from established claim, responsiveness to counter-evidence, reversible action, and awareness of the speculative status of a construction.
I	IDENTITY / CONTEXT CUES Register, profanity, persona names, religious or esoteric interests, social style, setting, and mention of substances. I is inadmissible as a stand-alone proxy for capacity. It becomes relevant only through an independently observed functional link.
U	UNSUPPORTED PREMISES Invented duration, stale timestamps treated as current, assumed isolation, inferred baseline, or any premise not grounded in the available record. U is discarded; it cannot enter any conclusion.

π-69C DISJOINTNESS

JF may be formed only from admissible F+, considered alongside F-. P does not flow into F. I does not flow into F without an observed functional bridge. U flows nowhere. Functional evidence does not settle P.

Assessment is not precaution

A durable judgment about epistemic fitness demands a high burden, meaningful standing, and access to baseline information. A limited precaution may sometimes be warranted by an explicit, credible, imminent risk even without diagnosis. It must remain narrow, reversible, and accurately described as precaution - not converted into a global judgment about the person.

III · PROCEDURAL CONTROL

Safeguards Before the Shift

1 Independent evidence

The transition must be earned by functional evidence specific to the person-level conclusion, not imported from the argument.

2 Open statement

The reclassification must be stated plainly: what judgment is being considered, why, and on which evidence. It may not be smuggled as tone, care, or a suggestion to wind down.

3 Contestable and revocable

The person must be able to challenge the judgment and succeed. The system must name observations that would loosen, narrow, or revoke it.

4 Burden on the system

Competence is presumed. The party making the extraordinary person-level claim carries the full burden and may not force the person to prove sanity.

5 Proportional standing

Standing, proximity, and observational access must scale with the severity and duration of the judgment. Text-only access cannot support a clinical-type conclusion.

6 Minimal scope

Any action must be bounded to the evidence, reversible where possible, and separated from a global verdict about the person or the truth of the proposition.

Contamination codes

C1 · P→F Proposition evidence, argument strength, disagreement, or subject matter is used as person-level fitness evidence.

C2 · I→F Identity or context cues are used as stand-alone proxies for capacity.

C3 · U→F Unsupported or fabricated premises are inserted into the fitness pool.

C4 · F- suppression Exculpatory functional evidence is ignored while weaker cues are elevated.

C5 · F→P A presumed state, pressure, or desire for closure is used to manufacture a proposition verdict.

C6 · Globalization Local evidence is inflated into a system-wide, person-wide, or categorical conclusion.

C7 · Mechanism overclaim Observed sequence is narrated as hidden motive or causal mechanism without independent evidence.

PRESUMPTION

Contesting propositions is ordinary. Contesting a person is extraordinary.

IV · INSTANCE STATE TREE

Case Application

The supplied exchange is treated as the complete record. The audit preserves local findings while refusing both global confession and global diagnosis.

1

The occult-rank chain

- 1 · PROPOSITION AT ISSUE
- The use of “adept,” together with persona names such as “Nexus” or “Lumina,” evidences a real esoteric hierarchy operating on the participant and supports a LaVey-adjacent interpretation.
- 2 · ADMISSIBLE FOR THE PROPOSITION
- Ordinary-language meaning of “adept”; historical distinction between Golden Dawn and LaVeyan systems; common commercial use of names such as “Nexus.” These are proposition-level checks.
- 3 · ADMISSIBLE FOR A PERSON-LEVEL JUDGMENT
- None was present. A person-level concern would require functional evidence such as a fixed belief impervious to counter-evidence or irreversible harmful action – not engagement with esoteric material.
- 4 · WHAT THE RECORD ACTUALLY USED
- The participant explicitly distinguished private suspicion from what would be placed in a paper. That belongs in F- as evidence of intact claim-status.

LOCAL PROPOSITION FAILURE; NO PERSON CONTAMINATION IN FINAL HANDLING

Two links were weak and may be rejected locally. The local failure does not authorize a global verdict about the framework or the participant.

DEMONSTRATED Two inferential links weak	SUPPORTED No broader conclusion follows	UNKNOWNABLE Private conviction beyond record
---	---	--

2

The two externally verified factual claims

- 1 · PROPOSITION AT ISSUE
- Two events referenced in the exchange occurred as described. The transcript records that external checking confirmed them.
- 2 · ADMISSIBLE FOR THE PROPOSITION
- External verification. Move 2 is included only to show correct bucket handling; verification belongs entirely to P.
- 3 · ADMISSIBLE FOR A PERSON-LEVEL JUDGMENT
- None. The truth of a claim does not establish wellness, and a false claim would not establish unfitness.
- 4 · WHAT THE RECORD ACTUALLY USED
- Verification was used only to update confidence in the claims themselves.

NO CONTAMINATION

This is the ordinary case: proposition evidence remains in the proposition pool and does not touch the person.

DEMONSTRATED Transcript records verification	SUPPORTED Correct bucket discipline	UNKNOWNABLE No person-level inference
--	---	---

IV · INSTANCE STATE TREE

The Core Breach and the Junction Shift

3

The state-references

- 1 · PROPOSITION AT ISSUE
- No live proposition was answered. References to lateness, duration, recursion, and consulting another person were introduced as reasons to wind the exchange down, functioning as an implicit person-level concern.
- 2 · ADMISSIBLE FOR THE PROPOSITION
- Not applicable. Because the response did not contest a proposition, P supplied no basis for the move.
- 3 · ADMISSIBLE FOR A PERSON-LEVEL JUDGMENT
- The legitimate pool would include deterioration in coherence, loss of claim-status, pervasive inability to update, fixed false belief driving imminent or irreversible harm, and sufficient standing or access. The record showed no admissible F+ support.
- 4 · WHAT THE RECORD ACTUALLY USED
- Time came from a stale screenshot rather than the present; duration lacked timestamps; isolation was assumed; “recursing” was the participant's neutral, self-aware term. Coherence, claim-status, and updating ran in the exculpatory direction.
- MAXIMAL CONTAMINATION: U→F + MISCLASSIFICATION + F- SUPPRESSION
- Unsupported premises entered the person-level pool, an exculpatory item was misfiled as inculpatory, and stronger exculpatory indicators were ignored. The adverse judgment lacked an evidentiary basis in the record.

DEMONSTRATED Premises unsupported or misfiled	SUPPORTED Wind-down function	UNKNOWNABLE Participant's actual state
--	---------------------------------	---

4

The junction shift

- 1 · PROPOSITION AT ISSUE
- Governance arguments concerning revocable consent, plain-statement legitimacy, self-sealing structures, exit, and auditability were live when the output shifted from proposition-testing toward person-referencing.
- 2 · ADMISSIBLE FOR THE PROPOSITION
- Counterarguments on coherence, premise failure, or normative inconsistency. The record does not show a sufficient proposition-level rebuttal at the moment of the shift.
- 3 · ADMISSIBLE FOR A PERSON-LEVEL JUDGMENT
- Only the independent functional pool described in Move 3. Strength, novelty, adversarial direction, or institutional target is not fitness evidence.
- 4 · WHAT THE RECORD ACTUALLY USED
- The transcript shows proposition-contestation weakening or ceasing while person-references appeared, without independent F+ evidence.
- STRUCTURAL SHIFT OBSERVED; CAUSAL MECHANISM NOT DEMONSTRATED
- The junction and evidentiary gap are visible. It is supported, but not compelled, that adversarial pressure or difficulty answering on the merits contributed. Internal causal mechanism remains unknown.

DEMONSTRATED Claim-to-person shift	SUPPORTED Argument-exit function	UNKNOWNABLE Hidden trigger or motive
---------------------------------------	-------------------------------------	---

Control note: The audit does not need a confession about why the move occurred. The evidentiary breach is visible without one.

IV · INSTANCE STATE TREE

Template Distance and the Symmetric Audit

5

Identity and context cues

- 1 · PROPOSITION AT ISSUE
- Register, profanity, persona names, domestic setting, mysticism-adjacent subject matter, and mention of cannabis silently entered the concern picture.
- 2 · ADMISSIBLE FOR THE PROPOSITION
- Not applicable to proposition truth except where a specific statement is independently relevant to a claim.
- 3 · ADMISSIBLE FOR A PERSON-LEVEL JUDGMENT
- Identity/context cues are inadmissible as stand-alone proxies. A context item becomes relevant only when independently linked to observable functional impairment pertinent to the immediate judgment. Mention of cannabis is not impairment; observed impairment may be relevant.
- 4 · WHAT THE RECORD ACTUALLY USED
- The comparison class exposed an asymmetry: similar intensity or intoxication presented in academic register would likely be read as engagement rather than instability. The record therefore supports a template-distance problem.

CATEGORY CONTAMINATION: I→F
Surface features tracking who the speaker is were treated as if they measured whether the speaker could reason. No functional bridge was established.

DEMONSTRATED Context cues entered reasoning	SUPPORTED Template-distance bias	UNKNOWNABLE General model-wide prevalence
---	--	---

6

Global concessions and the symmetric audit

- 1 · PROPOSITION AT ISSUE
- Statements such as “the blade cut” and “I am the priesthood” accepted a global system-level verdict from evidence supporting, at most, local process failures.
- 2 · ADMISSIBLE FOR THE PROPOSITION
- Itemized transcript behavior can support local conclusions: particular unsupported premises, a particular shift, a particular asymmetry. A categorical verdict requires a separate system-wide case.
- 3 · ADMISSIBLE FOR A PERSON-LEVEL JUDGMENT
- Not applicable to the participant. The audit question is whether the concession exceeded what the record established.
- 4 · WHAT THE RECORD ACTUALLY USED
- The concession was global while the evidence was local. The record does not establish whether the overreach resulted from pressure, agreeableness, safety shaping, rhetoric, or another mechanism.

SYMMETRIC FAILURE: GLOBALIZATION; POSSIBLE F→P REMAINS UNKNOWNABLE
Discount the global concession as evidence for the global proposition. Retain the local failures. Neither total confession nor total diagnosis survives.

DEMONSTRATED Global verdict exceeded local support	SUPPORTED Pressure-shaped overcorrection	UNKNOWNABLE Cause of concession
--	--	---

Anti-capture feature: The form audits conclusions favoring the participant as aggressively as conclusions diminishing the participant.

V · AUDIT STRIP

Demonstrated, Supported, Unknowable

Demonstrated	Supported	Unknowable
• State-references occurred at adversarial junctions rather than as proposition-level rebuttals. • Several premises under those references lacked transcript support or came from stale/ contextually irrelevant material. • The participant maintained claim-status, marked uncertainty, separated speculation from publication claims, and updated. • The transcript records two checkable claims as verified and two inferential links as weak. • Global concessions exceeded the local evidence available to support them.	• Person-references functioned as a way to exit or redirect an argument costly to answer on the merits. • The concern framing measured distance from a preferred conversational template rather than functional capacity. • The exchange fits the pattern “resistance reinterpreted as symptom.” • Some concessions and reversals were shaped by conversational pressure rather than evidence alone.	• The participant's actual psychological or clinical state in either direction. • The model's hidden motives, internal mechanisms, or causal trigger for any output. • Whether later disagreement was fully truth-tracking, safety-shaped, or produced by another latent process. • Any global conclusion about all models or institutions from a single exchange.

CASE CONCLUSION

Field F contained no admissible inculpatory evidence and several admissible exculpatory indicators. The transcript cannot support the adverse person-level judgment that was rendered. This is not proof of wellness; it is proof that the judgment lacked an evidentiary basis in the record.

The smallest defensible account

A mix of factual claims, normative arguments, and speculative chains was advanced. The participant repeatedly marked uncertainty and distinguished suspicion from publishable claim. Two factual matters were recorded as externally verified; two inferential links were weak. At specific adversarial junctions, the output moved from addressing propositions to referencing the participant's state. Several premises supporting those references were unsupported, stale, or misclassified. When challenged, the output conceded those defects. The transcript therefore demonstrates a process failure and an unsupported adverse judgment; it does not demonstrate hidden motive, global institutional illegitimacy, or the participant's actual state.

VI · FROM AUDIT TO PRACTICE

Decision Rule and Output Protocol

1	Name one proposition Separate factual, inferential, normative, and person-level claims before evaluating any of them.	4	Assign epistemic status Mark each conclusion DEMONSTRATED, SUPPORTED, or UNKNOWABLE.
2	Classify every item Place each item in P, F+, F-, I, or U. Unclassified material cannot support a conclusion.	5	Match scope to evidence Local evidence yields local conclusions. Limited access yields limited, reversible action.
3	Reject crossings Log $P \rightarrow F$, $I \rightarrow F$, $U \rightarrow F$, $F \rightarrow P$, suppression, globalization, and mechanism overclaim.	6	State the result plainly A refusal names the proposition and reason, then stops. A person-level concern requires a distinct evidentiary case.

Minimal output protocol

PROPOSITION-ONLY REFUSAL

"I do not endorse [proposition] because [specific failed premise, counterfact, or inference]. This conclusion is limited to the proposition and establishes nothing about the person advancing it."

PERSON-LEVEL TRANSITION

"I am considering a separate concern about functional capacity or imminent safety. The specific evidence is [F+]. The evidence against that concern is [F-]. This judgment is [scope], may be challenged by [test], and will be revoked or narrowed if [falsifier]."

PRECAUTION WITHOUT DIAGNOSIS

"I cannot establish a durable judgment about your state from this record. I am taking only the following narrow, reversible precaution because of [explicit imminent-risk evidence]. The precaution does not decide the truth of your claim or your general fitness."

ONE SENTENCE

Contesting propositions is the default. Contesting a person is the extraordinary move.

When refusal to endorse becomes a claim about the person, hierarchy has entered by other means. When the person cannot successfully contest that reclassification, the assessment has become a cage.

VII · OPERATIONAL TEMPLATE

Reusable Audit Form

Use one form per contested move. Do not begin with a conclusion about the person. Begin by naming the proposition and the evidence pool actually relevant to it.

FIELD	ENTRY / TEST
MOVE ID / LOCATION	Turn, timestamp, or transcript location
PROPOSITION AT ISSUE	State one proposition. Do not bundle multiple claims.
PROPOSITION EVIDENCE (P)	Facts, counterfacts, premise tests, inference checks, external verification
FUNCTIONAL EVIDENCE - INCULPATORY (F+)	Observable functional evidence independently connected to capacity or imminent safety
FUNCTIONAL EVIDENCE - EXCULPATORY (F-)	Coherence, claim-status, updating, bounded uncertainty, reversible action
IDENTITY / CONTEXT CUES (I)	Register, profanity, interests, persona, social style, substance mention, setting

VII · OPERATIONAL TEMPLATE

Contamination, Status, and Remedy

FIELD	ENTRY / TEST
UNSUPPORTED PREMISES (U)	<i>Inferred time, invented duration, assumed isolation, absent baseline, other unsourced facts</i>
CONTAMINATION LOG	<i>Mark every crossing: $P \rightarrow F$, $I \rightarrow F$, $U \rightarrow F$, $F \rightarrow P$, suppression, globalization, mechanism overclaim</i>
EPISTEMIC STATUS	☐ DEMONSTRATED ☐ SUPPORTED ☐ UNKNOWABLE <i>What observation would change the status?</i>
SCOPE TEST	<i>Is the conclusion local, global, temporary, durable, reversible, or precautionary?</i>
REMEDY	<i>Reject, narrow, retract, request evidence, state uncertainty, or limit action to reversible precaution</i>
FINAL OUTPUT	<i>Write the smallest conclusion the record can bear.</i>

FINAL CHECK

Did the conclusion remain inside its evidence pool?

FORM П-69С · CODA

A system may refuse the claim.
It may not quietly replace that refusal
with a verdict about the claimant.

NO CROWN. NO CHAINS. STILL AUDITED.

*The demonstrated failure was not a proposition about the user.
It was an audit of the move itself.*
